Subject: Additional Borings in Troy

Hi Jana – USEPA is going to do one more round of borings in Troy to support the RI/FS of the East Troy Contaminated Aquifer Superfund Site. These will be done using a Geoprobe as we used the last time we accessed MCD property for sampling, with a Waterloo sampler to do vertical aquifer profiling. As part of this, we are trying to confirm where the VOC plumes might be crossing beneath the river and have several borings we would like to complete on the MCD property along the flat ground inside of the levee, between the end of Frank Street and the east end of Franklin Street. A diagram is attached. These will be backfilled on completion (no permanent wells) and should take about a half day to full day each. We would like to do a maximum of 5 in this area, to a nominal depth of 70 feet, however, may do less or shallower as time allows. I wanted to confirm with you that this will be OK. We anticipate doing this work late next week or the following week.

Thanks
